

# XFEE Whitepaper

The Revenue Engine of Xtrends

## 1. Introduction

XFEE is the core value-capture token of the Xtrends ecosystem. It connects platform activity directly with token value through a structured buy-and-burn mechanism.

## 2. Core Mechanism

Each token launch on Xtrends generates fees. These fees are converted into SOL and used to buy XFEE from the market. Purchased XFEE is permanently burned, reducing supply.

## 3. Tokenomics

Total Supply: 1,000,000 XFEE Public Sale: 500,000 Liquidity: 100,000 Staking: 100,000 Treasury: 300,000

## 4. Liquidity Design

Liquidity is permanently locked. Every buyback adds SOL into the pool while removing XFEE, increasing depth and price stability.

## 5. Staking

100,000 XFEE is distributed over 36 months to incentivize long-term holding and reduce circulating supply.

## 6. Growth Flywheel

Platform usage generates fees → fees buy XFEE → XFEE is burned → supply decreases → price pressure increases → more adoption.

## 7. Economic Vision

XFEE is a deflationary asset tied directly to platform success. As adoption grows, supply decreases and liquidity strengthens.

## 8. Example

If 1M launches generate \$50 each, total revenue = \$50M. This creates continuous buy pressure and large-scale token burn.

## 9. Conclusion

XFEE converts platform activity into value. It represents a long-term, sustainable token model built on usage, not speculation.
